

MAYBE IT IS NOT TOO LATE.

There is a possibility for children to be saved by abortion pill reversal.

The abortion pill reversal hotline has received over 2,000 calls from hopeful women who changed their minds once they realized the pill might be reversed.

- The most common chemical (medication) abortion method involve a two-step drug process. The first abortifacient drug (mifepristone or RU-486) is given at the clinic and weakens or kills the baby but it has the potential to be reversed.
- The second drug, misoprostol, is taken 24-48 hours later, usually at home, to expel the baby and complete the abortion.
- The hearts of some woman may change during the 24-48 hour period after taking the first drug, mifepristone.

The APR hotline is: 1-877-558-0333
